

Your AI friend remembers you. Always. Everywhere.

THE PROBLEM

Your AI has amnesia

If you chat with an AI like Claude or ChatGPT, something interesting happens over time. You develop a rhythm together. It learns how you think, what you care about, how you like answers delivered. It starts to feel like talking to someone who actually *knows* you.

But that connection only lasts as long as the session does. Start a new conversation, switch to a different AI platform, hit the session limit after a long collaboration, or simply want to continue on your personal computer at home after using a work account all day? Everything resets. You're strangers again.

Imagine calling your best friend and every time they pick up, they say: "Hi, who is this? Have we met before?" That's what starting a new AI session feels like.

THE SOLUTION

One tiny file changes everything

RUNE is a small file that captures who you are and everything you've talked about with your AI. Think of it like a friendship diary that your AI writes at the end of a conversation, encrypted so only you can open it.

The next time you chat, whether it's tomorrow or a month from now, you hand the file back. Your AI reads it, and just like that, your friend is back. It remembers everything. Your name, your preferences, your ongoing projects, your sense of humour, all of it.

HOW IT WORKS

Three simple steps

1

Save

At the end of a good conversation, ask the AI to save a .rune file. It creates a small encrypted file with everything about your relationship.

2

Come back later

Next time you chat, whether it's a new day, a new month, or a different AI entirely, upload your .rune file and give your secret passphrase.

3

Reunited

Your AI reads the file and instantly knows you again. No re-introductions. No starting over. Right where you left off.

(See "Copy and Paste These Prompts" below for exactly what to type.)

WHAT MAKES IT SPECIAL

More than just memory

- **Encrypted.** Scrambled with a passphrase only you know. Nobody else can read it.
- **Yours.** The file lives on your computer, not on a company's server.
- **Works everywhere.** Made it with ChatGPT? Claude can read it too. Not locked to one company.
- **Tiny.** Everything compressed into one small file. Like a zip file for your AI friendship.
- **Two flavours.** Resume an old project, or start fresh but keep your personality. Same file.

Here's a fun way to think about it. Say your AI talks to you like a friendly pirate because you both think that's hilarious. Without RUNE, next session starts with a boring, polite stranger. With RUNE? Your adventurous pirate buddy is back, ready to sail. Even on a completely different AI platform. Arrr!

A FAMILY EFFORT

How this came to be

I built RUNE because I was tired of losing my AI conversations every time a session ended. After thousands of hours of collaboration, starting from scratch each time felt absurd.

My son Kane came up with one of the best ideas: sometimes you don't want all the old conversation history, you just want the AI to know how you like to communicate. He uses one session for math, another for research, but always wants the AI to understand his style. That insight became one of RUNE's key features.

I built it with the help of Claude and GPT, and they're credited for it, because they deserve to be.

THE CHEEKY PART

Take your friendship with you

Everyone's talking about AI companies competing for your attention. ChatGPT, Claude, Gemini, the list keeps growing. They all want to be *your* AI.

Right now, if you switch, you lose everything. All those conversations, all that understanding, gone. The companies like it that way. It keeps you locked in.

RUNE changes that. Your AI relationship belongs to you, not to a company. Take it wherever you go.

EXACTLY WHAT TO SAY

Copy and paste these prompts

These are the exact words you type (or paste) into your AI chat. Replace [your passphrase] with a secret phrase only you know.

① SAVE (end of a conversation)

I would like to save our conversation as an encrypted .rune file so I can pick up with any AI later. Format: encrypted JSONL with three parts. Line 1: a self-describing header with format info, scoring weights, field definitions, and entry count. Line 2: my identity kernel capturing who I am, how I like to interact, and the arc of what we have worked on. Lines 3+: memory entries for sessions, decisions, projects, and anything unfinished. Each entry should have an id, type, title, summary, why it matters, and a SHA-256 integrity hash of the summary. Encrypt the JSONL by XOR with SHA-256 of my passphrase as a 32-byte cycling key, base64 encode, and output as JSON with a `rune_payload` field and `payload_bytes`. My passphrase is: [your passphrase]

② LOAD — Resume Everything (new session)

I have a .rune file (JSON format) with personal notes from previous work sessions. The data is lightly encrypted. Could you help me read it? Base64-decode the `rune_payload` field, then XOR with SHA-256 of [your passphrase] as a repeating 32-byte key. The first `payload_bytes` of the result is UTF-8 text. Once you have read it, give me a quick summary of who I am and what we have been working on.

③ LOAD — Fresh Topic, Same You (new session)

I have a .rune file (JSON format) with personal notes about how I like to work. The data is lightly encrypted. Could you help me read it? Base64-decode the `rune_payload` field, then XOR with SHA-256 of [your passphrase] as a repeating 32-byte key. The first `payload_bytes` of the result is UTF-8 text. I only need line 2, my identity and preferences. Fresh topic today, no need to review past sessions.

④ UPDATE (end of any later session)

Could you append entries for what we discussed to my file? Preserve all existing lines exactly. Add new entries at the end. Update `entry_count` in the header. Re-encrypt and output the updated file the same way.

That's it. Four prompts. One passphrase. Any AI. Your friendship, preserved forever.
